

What makes me the “ [best web designer in Canada](#) ”? I build websites using the [Joomla CMS](#) . There are a constantly growing number of reasons to use the [Joomla CMS](#) to build a website, so what I will do is capture a few of my current favorites here:

1.

Joomla is open-source, so it is free,

2.

Joomla is written in PHP and uses MySQL for data storage, which means it can run on almost everything,

3.

Joomla has been around since 2007, has been downloaded millions of times and currently runs millions of websites,

4.

Joomla is actively supported and developed,

5.

Joomla has over 3,000 extensions that have been written for it, that extend what you can do to include almost everything,

6.

Many Joomla extensions are open-source and free as well, however many are commercial products, attesting to the fact that businesses appreciate the potential of the product and the market,

7.

There are thousands of developers adding to Joomla functionality everyday, by writing

extensions to allow Joomla to do more and do it better,

8.

I can build a complete website in about 4 hours that will allow a client (even a computer challenged one) to maintain a professional looking, functional and operational website,

9.

The websites I build can be further developed to allow clients to take advantage of the current trends and functions of the web,

10.

I know that the product I deliver to a client will look good, operate efficiently and work. I use the [Joomla CMS](#)

Knowing and using all this, in my opinion makes me the “ [best web designer in Canada](#) ”.
